

OPTIALIGNER

OptiAligner is designed to eliminate "banana shaped fish" for the pelagic industry. The OptiAligner directs the fish in a parallel position before it's dropped into the boxes. Packing becomes tidier and the fish retains its proper shape.

OptiAligner will increase the value of the product by eliminate problems with "banana shaped" fish. Due to the large volume produced on a typical packet line, even the smallest value increase profit significantly.

Tests have showed that the result in quality of using OptiAligner is the same as you would find in manually placed fish in cartons.

The OptiAligner has been developed in collaboration between Optimar and Pelagia, with financial support from FHF. The support has been very important for carrying out the project, which has been long-awaited by the industry, but has been too undefined and uncertain to be sold as a prototype alone.

Find out more: www.optimar.no or www.fhf.no where one can read the project's final report.

SPECIFICATIONS

OptiAligner eliminates former problems with frozen banana fish, where the fish becomes skewed after thawing.

OptiAligner is specially designed to easily merge onto most types of packaging lines and is placed on the packing line between batch weight and carton boxes. The capacity of the packing line is not affected by using OptiAligner. In addition, both packages and pallet stacks are more in line by using OptiAligner.

Emphasis has been placed on a hygienic design in stainless steel and good access for cleaning. A separate washing position ensures good access when washing.
